Bug #34229 in firefox mozilla-firefox (Ubuntu): "Creating readable pdf"

Fix Requested In	Status	Severity	Assigned To
firefox mozilla-firefox (Ubuntu)	Unconfirmed	Normal	—
Request fix: + Upstream... + In Distribution...			

All the new Mozilla based browsers have a Mozilla Postscript Module that makes the document like image. That means there is not even one letter there and you cannot go back to the url and not to copy something. I use cups-pdf 2.0.5 and ghostscript 8.53 which with Mozilla-suite (has a previous version of this module and doesn't support non latin characters) and I can print readable pdfs from web pages, something I can not do with Firefox, Epiphany, Galeon and Konqueror (has another module). I think the same problem exists with Gnome Print Version 2.12.1.

I understand that with this module I can print texts in any language and this is very important, and the price I have to pay is that when I try to print it to pdf to print it as an image. However, that is not useful for a later use. I can not even follow the url. I also understand that it is a part of all the new mozilla products and of products depend on them.

Is it possible at least for some browsers this Mozilla postscript module to enabled or disabled via synaptic? Or could it someday this module be enabled or disabled in the printer dialog?

Thank you for your time. I hope there would be a solution.
