

Female labour supply and time use

David Vonka

20.11.2007

Research questions

- 1 Where does the extra working time come from ?
- 2 General picture of female time use
- 3 How does non-parental childcare interact with timeuse ?

- Literature review
- Data (and its limitations)
- Empirical results

- Aguiar-Hurst(2006)
- Hamermesh, Pfann(2004)
- Ichino, Galdeano(2006?)
- Bianchi(2000)
- Bryant, Zick(1996)
- Ruhm (2004)
- Folbre, Yoon (2007)

Data (and its limitations)

- TBO in 1980,85,90,95 and 2000. 14453 people aged 12+.
- Only one in a family !
- diary + background information.
- Wealth and income information missing. Education available.
- No "with whom" info. Very little "secondary activity" info.
- ... but observed in 7 days.
- Therefore no structural model

- We only include grown-ups (20-55 yo) living in a couple and having a child(<18yo) at home.
- Define three groups: working mothers, stayhome mothers and fathers.
- Activities: formal work, household work, personal time, studying, active time with children and passive time with children

Trends of time use

	Working mothers	Stayhome mothers	Fathers
Formal work	19,2 ↑	—	38,5 ↑
Housework	20,4 ↓	27,2 ↓	7,9 ↓
Personal	50,1 ↓	53,5 ↓	47,6 ↓
Act childcare	1,9 ↑	2,7 ↑	1,2 ↓
Pas childcare	4,8 ↑	7,4 ↑	1,6 ↑
Free time	22,4 ↓	27,9 ↓	21,8 ↓
Studying	1,2 ↓	1,2 ↓	1,4 ↓
Nr. of kids	1,9 ↓	2,1 ↓	2,0 ↓
Δ Education	1,5	1,2	1,4
Sample size	1014	1748	1813

The regression model

- **Dependent variable:** Time spent in activity A during the 5 working days
- **Independent variables:** Year dummies, age, age², working time, partner's working time, kids <3yo dummy, kids 4-12yo dummy, 2 kids dummy, 3+ kids dummy, education level dummies.
- OLS & Tobit

Where does the working time come from ?

	Working mothers		Fathers	
Housework	25	↓	18	↷
Personal	11	↷	14,5	
Act childcare	2	↑	1,4	↑
Pas childcare	5,4	↕	4,4	↑
Free time	15	↷	20	↷
Studying	1,5	↑	2	

1 Personal needs

- Year effects: Every five years an hour less of personal care for working people.
- Negative effects of many and/or small children (ca 1.5 hour)

2 Housework time

- Small children lead to less housework
- More children lead to more housework
- Education leads to much less housework. No year effects.
- Men have a positive time trend, negative effect of more children. No effect of education.

3 Free time

- -1.5h per kid. -5h for small kids. -2h for 4-12yo.
- Men's free time decreased when their spouses worked in the 80's. Higher education leads to less free time. Negative effect of small children. Negative trend.

- Female labour supply is mainly compensated by housework and free time
- ... but still work has a negative effect on time spent actively with children
- ... and this negative effect has intensified over time
- Nonparental childcare correlates positively only with formal labour. Other activities are suppressed.
