

Procedure to reproduce the bug :

Install additional drivers and select NVIDIA Drivers metapackage nvidia-driver-470 (owner, tested) and apply changes.

Rebooting.

I start firefox with et 4K vidéo for exemple.

10 secondes after, freeze is present.

I can move le mouse, but i can't get a display with line command when i press ctrl + alt + F3 for exemple, i can not do anything.

I can hear the sound of the video while 2 minutes and it begin to stop, replay, stop.

I have to use an other pc with which i can connect on the freeze pc thru ssh client and start ubuntu-bug to report the bug without nvidia-bug-report because the program never stop to give me the hand.

Last information, after hard reboot, i canwrite this document without freeze ...
